WHAT ARE VOLCANOES?

Volcanoes are mountains where lava erupts through the Earth's surface. They are named after the Roman God of fire, Vulcan

WHERE ARE VOLCANOES FOUND?

There are around 1,350 active volcanoes worldwide, with some even under the oceans. Most are found around the Ring of Fire, where tectonic plates meet.

VISIT A VOLCANO

You can see some volcanoes around the world from Space using Google Earth watch videos here

FAMOUS VOLCANOES

Here you can watch some video factfiles about famous volcanoes around the world

HEIGHT: 3350M

FAMOUS ERUPTIONS

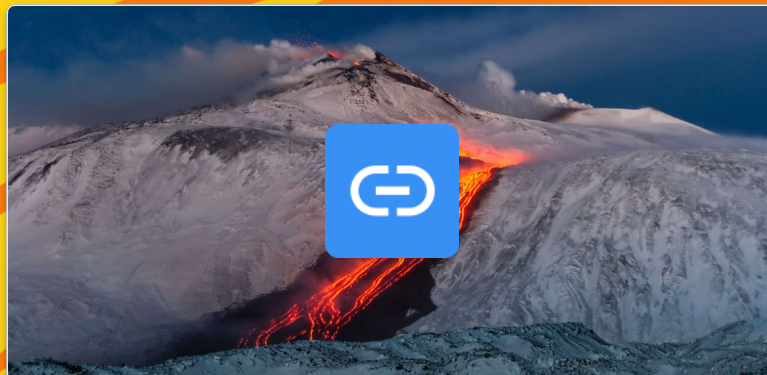

Of the many eruptions around the world, one of the most well-known is the eruption in 79AD of Mount Vesuvius which buried Pompeii

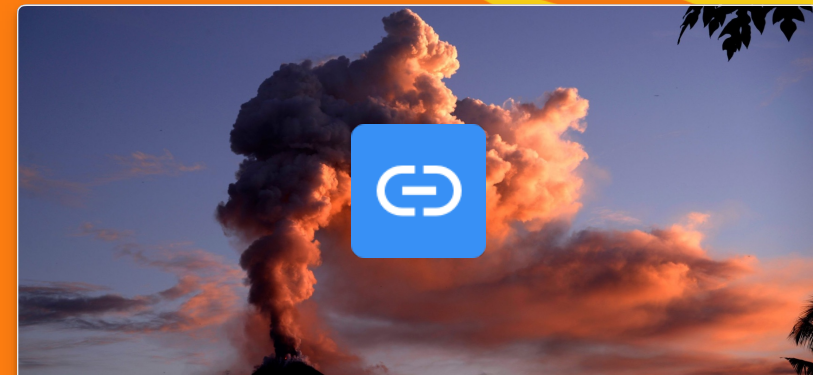

Thankfully RAMJS isn't built on meeting points of tectonic plates, but if it were we might have these popping up outside
